Course title	Advanced Control Theory																
Course number	0908725																
Credit hours (lecture and lab)	3 (3 + 0)																
ECTS (weekly contact and self-study load)	6 (3 + 3)																
Prerequisites/co-requisites	0908721 (Robotic Systems)																
Prerequisites by topic	Understanding of modeling and dynamic response is necessary. An elementary understanding of matrix algebra is necessary too.																
Level and type (compulsory, elective)	Masters' elective course																
Year of study and semester	First year, second semester																
Description	This graduate course concentrates on the analysis and design of feedback control systems. This course has a preferential bias towards robotic applications. The core of this course presents the design method based on state-variable feedback. The course then develops in more detail the tools needed to design feedback control for implementation in a digital computer. Towards the end of the course the nonlinear material includes techniques for the linearization of equations of motion, analysis of zero memory nonlinearity as a variable gain, frequency response as a describing function, the phase plane, Lyapunov stability theory, and the circle stability criterion.																
Objectives	<ol style="list-style-type: none"> 1. Introduce students to state-space design. 2. Introduce students to digital control. 3. Introduce students to nonlinear systems. 4. Introduce students to control system design. 																
Intended learning outcomes	<p>Upon successful completion of this course, students will be able to:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 5%;">No</th> <th style="width: 75%;">Intended learning Outcome (ILO)</th> <th style="width: 20%;">Program learning outcome (PLO)*</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">1</td> <td>Acquire knowledge of state-space and compensator design in modern control systems.</td> <td style="text-align: center;">2</td> </tr> <tr> <td style="text-align: center;">2</td> <td>Derive discrete-time mathematical models.</td> <td style="text-align: center;">2</td> </tr> <tr> <td style="text-align: center;">3</td> <td>Demonstrate analysis and design of nonlinear systems.</td> <td style="text-align: center;">3</td> </tr> <tr> <td style="text-align: center;">5</td> <td>Develop design skills in important control problems in robotics.</td> <td style="text-align: center;">4</td> </tr> </tbody> </table> <p>(*) The PLOs are listed in the appendix</p>		No	Intended learning Outcome (ILO)	Program learning outcome (PLO)*	1	Acquire knowledge of state-space and compensator design in modern control systems.	2	2	Derive discrete-time mathematical models.	2	3	Demonstrate analysis and design of nonlinear systems.	3	5	Develop design skills in important control problems in robotics.	4
No	Intended learning Outcome (ILO)	Program learning outcome (PLO)*															
1	Acquire knowledge of state-space and compensator design in modern control systems.	2															
2	Derive discrete-time mathematical models.	2															
3	Demonstrate analysis and design of nonlinear systems.	3															
5	Develop design skills in important control problems in robotics.	4															
Teaching and learning methods	Development of ILOs is promoted through the following teaching and learning methods:																

	<ul style="list-style-type: none"> Lectures will be delivered in person and through Microsoft Teams and will be recorded for later access. The control lab is open for the students to practice the practical aspects. The student attends the class presentations and participates in the class discussions. The student joins the related online team/group and participates in its discussions. The student studies the reference material, including books and videos. The student solves the control assignments using appropriate tools. The student carries out a term project for solving a particular control problem. The student develops a professional report for the term report. The student presents the term project in class. 																																																												
Learning material	Textbook, class handouts, lecture notes, selected YouTube videos and recordings.

	<ul style="list-style-type: none"> • Open-book exams • All submitted work must be of the submitting student. • Other text or code must be properly quoted with clear source specification. • Cheating will not be tolerated. <p>E- Available university services that support achievement in the course:</p> <ul style="list-style-type: none"> • Microsoft Teams team and Moodle course page • AI Lab for practicing the practical aspects and solving the programming assignments. • Program announcements Facebook group
Additional information	None

Appendix

Learning Outcomes for the MSc in Artificial Intelligence and Robotics

Students who successfully complete the MSc in Artificial Intelligence and Robotics (AIR) will be able to:

1. Demonstrate a sound understanding of the main areas of AIR including artificial neural networks, machine learning, data science, industrial and service robots, and intelligent and autonomous robots.
2. Apply a critical understanding of essential concepts, principles and practices of AIR, and critically evaluate tools, techniques and results using structured arguments based on subject knowledge.
3. Apply the methods and techniques of the AIR fields in the design, analysis and deployment of AIR solutions and solving practical problems.
4. Demonstrate the ability to produce a substantial piece of research work from problem inception to implementation, documentation and presentation.
5. Demonstrate life-long learning, independent self-learning and continuous professional development skills in the AIR fields.
6. Demonstrate a sound understanding of the ethical, safety and social impact issues of AIR solutions and products.
